To Whom It May Concern:

Pro CNC Inc. provides quality CNC machining to many high tech companies located through out the United States as well as customers located abroad and we employ about 45 people. We proudly provide services to our customers using the most modern equipment available including our flexible manufacturing cell with robotic part loading. Pro CNC Inc. has been ranked as one of the fastest growing private companies in Washington State, 3 times since 2001 according to the Puget Sound Business Journal.

Several months ago we were shown a new work piece-clamping device called BlokNgrab. Within the terms of the BlokNgrab non-disclosure agreement, the owners of Pro CNC Inc. reviewed the BlokNgrab invention together with the BlokNgrab working models. We found this device to be "as claimed" by the Inventor. The BlokNgrab work piece-clamping device is a truly unique concept. Its operating principals are of a sound design. The BlokNgrab device is simple and appears to be very cost effective to manufacture. Pro CNC designs and builds a large amount of tooling for CNC machining centers, however, we know of no other product that is similar in concept or usage when compared to the BlokNgrab device.

This product is an excellent fit to our manufacturing capabilities, however, it is not a good fit to our current Sales, Marketing and Merchandising capabilities. Based upon this, we regret that we are not in a position to help the BlokNgrab product move forward into the market place. We do believe this product will have a broad appeal within the CNC machining/tooling marketplace.

Sincerely,

Darcy Hughes, President, Pro CNC Inc.
